PROFESSIONAL SUMMARY

3 Years as Data Engineer at Hexaware Technologies from May 2022 to Till Date

Experienced in designing, developing, and managing robust data pipelines and architectures using technologies like Python, PySpark, Azure Data Factory, Databricks, SQL and Spark. Adapt at ETL processes, data modeling, and data warehousing solutions, with hands-on expertise in cloud platforms (Azure, AWS). Skilled in optimizing data workflows for performance, scalability, and reliability while ensuring data security and compliance. Strong problem-solving abilities with a focus on delivering data solutions that support business intelligence and analytics Python, SQL, Databricks, Azure Data Factory, PySpark, Apache Spark, Hadoop, Hive, ETL (Extract, Transform, Load), Apache Hadoop, Apache Spark, AWS (S3, Glue, Redshift, Lambda, EC2), Azure (Data Factory, Databricks, Synapse, Blob storage, ADLS, Azure DevOps, Logic Apps), Google Cloud (Cloud Storage, Dataflow), MySQL, PostgreSQL, Oracle, Data Modeling, Star Schema, Snowflake Schema, Dimensional Modeling, Data Lineage, Apache Airflow, AWS Step Functions, Git, CI/CD, GitLab CI, Data Security, Power BI, Problem Solving, Communication, Project Management.

EXPERIENCE

Data Engineer

Global Pharmaceutical Company / United States

2023 - Now

Project Name:

AUEU Bifurcation – Pharmaceutical Sales Data Pipeline

Technical Skills:

AWS S3 | AWS Lambda | AWS EMR (Spark) | AWS Step Functions | Python | PySpark | Spark SQL | Pandas | AWS CLI | Boto3 | Veeva CRM | Data Validation | ETL | Data Quality Framework

Project Overview:

The project involved **bifurcating an existing multi-region pharmaceutical sales data pipeline** to create a **dedicated Australian (AU) region pipeline** for improved performance, compliance, and targeted analytics.

The new AWS-based pipeline automates data ingestion, validation, transformation, and delivery of sales, customer, and marketing data into **Veeva CRM**. It processes hundreds of GBs daily, delivering actionable insights to pharmaceutical sales representatives through personalized recommendations, visit scheduling, and product targeting.

Key Responsibilities:

- Designed and developed a **region-specific data pipeline** on AWS to process and deliver sales and HCP data for the Australian market.

- Implemented **data validation and schema checks** using **AWS Lambda** and **Python (Boto3)**.
- Built and optimized **PySpark transformation jobs** on **AWS EMR** for data cleansing, deduplication, and aggregation.
- Automated workflow orchestration using **AWS Step Functions** for end-to-end process scheduling, retries, and monitoring.
- Applied **business logic mapping and data formatting** for integration with **Veeva CRM**.
- Ensured **data quality, referential integrity, and compliance** through validation reports and audit logs.
- Configured **IAM roles and access control policies** for secure data movement across S3 buckets.
- Collaborated with cross-functional teams to ensure smooth deployment, testing, and validation across environments.

Outcome:

- Successfully implemented a **scalable and compliant data pipeline** dedicated to the Australian region.
- Reduced data processing time from **8 hours to under 2 hours** through automation and Spark optimization.
- Achieved **99% data accuracy** with automated validation and deduplication frameworks.
- Enabled **data-driven decision-making**

Data Engineer

Enphase / United States

2022 - 2023

Project Name:

Enphase – Oracle to RDBMS Data Migration Technical

Skills / Tech Stack:

- **Data Source:** Oracle ERP
- **Cloud Platform:** AWS
- **Orchestration:** Apache Airflow
- **Processing:** Databricks (PySpark)
- **Transformation:** PySpark, SQL
- **Target System:** RDBMS(Redshift)
- **Visualization & Reporting:** Microsoft Power BI

Project Goal:

Converge Oracle ERP data into a RDBMS(Redshift) on AWS with Databricks, ensuring all business intelligence insights originate from a single, governed, and centralized source.

Problem Statement:

The client required a unified view of all Oracle ERP data within a centralized BI platform. Currently, data was dispersed across multiple silos, restricting

cross-domain analytics and strategic decision-making. The goal was to migrate, standardize, and transform these datasets into a cohesive, analytics-ready structure hosted on AWS, enabling holistic reporting and faster business insights.

Solution:

The project transitioned Oracle ERP data into a centralized RDBMS using **AWS** for infrastructure and **Databricks** for large-scale transformation and processing.

- **Airflow** orchestrated end-to-end ETL workflows.
- **PySpark** handled data cleaning, standardization, and enrichment.
- The transformed data was stored in **RDBMS**, ensuring data governance and accessibility.
- The solution enabled seamless **Power BI** integration, offering real-time financial and operational insights across departments.

Data Migration Workflow (Stepwise):

1. **Source:** Data extracted from on-prem Oracle ERP databases.
2. **Trigger:** Airflow DAGs initiated ETL workflows at defined schedules.
3. **Extraction:** Raw data extracted and stored as intermediate Parquet files in the staging layer.
4. **Transformation:** PySpark scripts applied cleansing, enrichment, and restructuring logic.
5. **Load:** Processed data loaded into the RDBMS (sink database)
6. **Scheduling:** Batch loads executed 4 times daily

EDUCATION

BE in Computer Technology

Gondwana University

2014 - 2018

M Tech in Computer Science

Gondwana University

2018 - 2020

SKILLS

SQL	Python
Data Mining	Data Warehousing
Apache Hadoop	ETL
NoSQL	Apache Spark
Cloud Computing	Data Modeling
Business Intelligence	Data Visualization

Azure Data Factory

Azure Data Bricks

AWS | s3 | Lambda | RDS Redshift |

Azure Logic App

Pyspark

Data Validation

Cloud Computing

Data Quality

Data Analysis

AWS Data Pipeline

Azure Data Lake

AWS Sagemaker

Snowflake

Data Migration

Data Modeling
